June 10, 1963

U. S. Government Nashington, D. C. SUBJECT: Proposal for preliminary development and fabrication of Chip Cutter-Viewer in accordance with Spec. #101 dated March 26, 1963 and Proposed Specification for Chip Cutter-Viewer Lune 10, 1963 Gentlemen: We are pleased to submit our proposal to perform preliminary development and fabrication of a Chip Cutter-Viewer unit as described in the referenced specifications. The scope of the proposed work is to be limited to proving the feasibility of the cutter head mechanism; the szimuth setting and adjustment; evaluation of die design and materials; and some aspects of the film handling problem. It is not the intent of this proposal to furnish a finished piece of equipment, but rather to provide the basis for a sound design for equipment to be proposed subsequent to successful completion of these studies. The unit proposed would include the male and female die sections mounted on a suitable frame having 12" minimum depth of throat fram the centerline of the die, and having centeined the azimuth indexing and lecking means. The proposed unit would have manual actuating means for cutting chips from test films and elementary means for illumination of the chip area and removal of the chip from the die. This unit would provide the basis for evaluation of further design proposals and lead to solutions for the primary problems of the final design. We estimate that this work can be completed in 12 weeks from date of authorization. We trust the above information is satisfactory. If further information is STATINTL required, please advise. STATINTL		
SUBJECT: Proposal for preliminary development and fabrication of Chip Cutter-Viewer in accordance with Spec. #101 dated March 26, 1963 and Proposed Specification for Chip Cutter-Viewer June 10, 1963 Gentlemen: We are pleased to submit our proposal to perform preliminary development and fabrication of a Chip Cutter-Viewer unit as described in the referenced specifications. The scope of the proposed work is to be limited to proving the feasibility of the cutter head mechanism; the azimuth setting and adjustment; evaluation of die design and materials; and some aspects of the film handling problem. It is not the intent of this proposal to furnish a finished piece of equipment, but rather to provide the basis for a sound design for equipment to be proposed subsequent to successful completion of these studies. The unit proposed would include the male and female die sections mounted on a suitable frame having 12 minimum depth of throat from the centerline of the die, and having centained the azimuth indexing and locking means. The proposed unit would have meaned actuating means for outting chips from test films and elementary means for illumination of the chip area and removal of the chip from the die. This unit would previde the basis for evaluation of future design proposals and lead to solutions for the primary problems of the final design. We estimate that this work can be completed in 12 weeks from date of authorization. We estimate that this work can be completed in 12 weeks from date of authorization. Very truly yours.		
SUBJECT: Proposal for preliminary development and fabrication of Chip Cutter-Viewer in accordance with Spec. #101 dated March 26, 1963 and Proposed Specification for Chip Cutter-Viewer in June 10, 1963 Gentlemen: We are pleased to submit our proposal to perform preliminary development and fabrication of a Chip Cutter-Viewer unit as described in the referenced specifications. The scope of the proposed work is to be limited to proving the feasibility of the cutter head mechanism; the azimuth setting and adjustment; evaluation of die design and materials; and some aspects of the film handling problem. It is not the intent of this proposal to furnish a finished piece of equipment, but rather to provide the basis for a sound design for equipment to be preposed subsequent to successful completion of these studies. The unit proposed would include the male and famile die sections mounted on a suitable frame having 12° minimum depth of throat from the centerline of the die, and having centained the aximuth indexing and locking means. The proposed unit would have manual actuating means for cutting chips from text films and elementary means for illumination of the chip area and removal of the chip from the die. This unit would provide the basis for evaluation of future design. ATINITL We estimate that this work can be completed in 12 weeks from date of authorization. We trust the above information is satisfactory. If further information is STATINITL Yeary truly yours.		
We are pleased to submit our proposal to perform preliminary development and fabrication of a Chip Cutter-Viewer unit as described in the referenced specifications. The scope of the proposed work is to be limited to proving the feasibility of the outer head mechanism; the azimuth setting and adjustment; evaluation of die design and materials; and some aspects of the film handling problem. It is not the intent of this proposal to furnish a finished place of equipment, but rather to provide the basis for a sound design for equipment to be preposed subsequent to successful dempletion of these studies. The unit proposed would include the male and female die sections mounted on a suitable fysse having 12° minimum depth of throat from the centerline of the die, and having centeined the azimuth indexing and lecking means. The proposed unit would have meanual actuating means for cutting chips from test films and elementary means for illumination of the chip area and removal of the chip from the die. This unit would provide the basis for evaluation of future design proposals and lead to solutions for the primary problems of the final design. ATINTL We estimate that this work can be completed in 12 weeks from date of authorization. We trust the above information is satisfactory. If further information is required, please advise. Very truly yours. PROPOSED SPECIFICATION FOR CHIP CUTTER-VIEWER.

STATINTI

proposes to design and fabricate the Chip Cutter-Viewer in accordance with customer specification #101, dated March 26, 1963 except # follows:

> 1. No change 1.1 No change 1.2 No change 1.3 No change 2. No change 2.1 No change 2.2 No change 2.4 No change 2.5 No change 2.6 No change

2.6.1 No change 2.6.2 No change 2.6.2.1 See 2.6.2.1 below 2.6.2.2 See 2.6.2.2 below

2.6.2.3 See 2.6.2.3 below

2.6.2.1 Die Cutter illumination and Removal of Chips. The female section of the die will be located in the upper arm section above the film plane. The male section of the die will be logated in the lower arm below the film plane and will be actuated by a manually operated ball screw mechanism. The chip will be pushed upward through the female die and can be removed from the die with a vacuum wand or air ejector. A lamp will be provided in the male die to provide sufficient illumination to permit inspection of the chip location prior to cutting if desired. The primary positioning of the film in the dies will be controlled by the index movement from the target stage to the dies.

2.6.2.4 See 2.6.2.2 below

2.6.2.2 Magnifier. A 2X magnifier is to be provided on an arm over the target stage to aid in accurate location of the image framing and eximuth positioning.

> 2.6.3 No change 2.6.3.1 No change 2.6.3.2 No change

Support Base. The support base shall be of a type to 2.6.3.3 adequately support the entire cutter-viewer assembly. Its height shall be such as to provide a working height of 34 inches at the top surface of the light table. The support base shall have suitable casters with wheel and swivel lock on at least two casters for stabilizing the cutterviewer in use.

Approved For Releans 2003/05/15: CIA-RDP78B0474747A0003081990344hge 4. No change 3. No change 3.2 No change 3.4 No change
